## What is Tuberous Sclerosis?

Tuberous sclerosis complex (TSC) is a rare genetic disorder that affects multiple organs in the body, including the brain, skin, kidneys, heart, and lungs. It is caused by mutations in either the TSC1 or TSC2 genes, which are responsible for producing proteins that help regulate cell growth and division.

TSC is characterized by the formation of non-cancerous tumors called hamartomas. These tumors can occur in any organ, but they are most commonly found in the brain, skin, and kidneys. TSC can also cause other symptoms, such as seizures, developmental delays, intellectual disability, and autism.

## Diagnosis of Tuberous Sclerosis

TSC is usually diagnosed based on a combination of physical examination, medical history, and imaging tests. A doctor may suspect TSC if a person has multiple hamartomas, seizures, developmental delays, or other symptoms of the disorder.

Imaging tests, such as MRI and CT scans, can help to confirm the diagnosis of TSC. These tests can show the presence of hamartomas in

the brain, kidneys, or other organs.

## **Treatment of Tuberous Sclerosis**

There is no cure for TSC, but there are treatments that can help to manage the symptoms of the disFree Download. Treatment options may include:

- Medications to control seizures
- Surgery to remove or reduce the size of hamartomas
